Why This Segment?

WHO ARE WE STUDYING?

Indian college students (18-24) using ChatGPT on mobile during high-stakes moments

UNIFIED BY ONE JOB: Performing well when outcomes matter most

CONTEXTS (Across Academic + Professional):

ACADEMIC:

- Semester exams
- Entrance tests (CAT, GATE, CLAT)

PROFESSIONAL:

- Government exams (Banking, SSC, UPSC)
- Campus placements & job interviews
- Internship preparation

COMPETITIVE SKILLS:

Building competitive advantage

PROOF OF COHERENCE:

- Different contexts, ONE coherent mindset
- Time-pressured across ALL scenarios
- Consequence-aware in ALL situations
- **82%** of survey respondents confirmed segment fit

User Research Insights: Quantitative and qualitative findings on voice input adoption

RESEARCH & ADOPTION SNAPSHOT

Research Snapshot

- n = 60 Indian college students (18–24)
- Frequent ChatGPT mobile users
- Survey with open-text responses
- Focused on exam & placement workflows

PERSONAS (QUALITATIVE INSIGHTS)

Persona 1 — Exam Prep Student

- Context: Semester exams, CAT/GATE/CLAT prep
- Experience: Tried voice → incorrect transcription → abandoned

> "I can't afford wrong queries when grades matter."

Persona 2 — Interview Prep Student

- Context: DSA learning, placement interviews, multi-app workflow
- Experience: Uses voice casually, types for interviews

> "Hands-busy, but precision is non-negotiable."

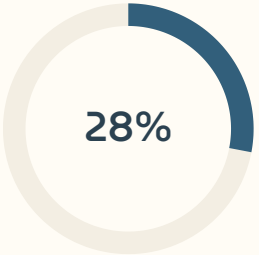
PAIN POINTS & BLOCKERS

1. 48% — Can't see or edit before sending
2. 26% — Accuracy concerns
3. 16% — Prefer typing for precision
4. 16% — Privacy & noise concerns

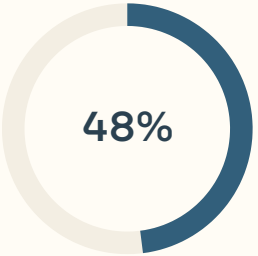
Top 2 blockers = 74% of all objections

One concentrated issue: lack of verification and control.

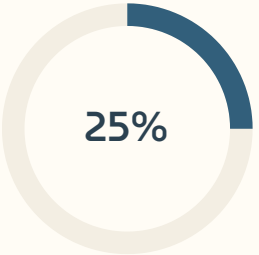
Voice Adoption Breakdown



Regular voice users



Tried voice but paused



Never tried

Nearly half the users already tried voice — this is not a discovery problem.

Key Insight: "Users are not rejecting voice — they paused because they can't verify before sending."

Made with GAMMA

Problem Framing: Why Voice Fails in High-Stakes Moments

What Is the True Problem?

Voice input breaks in high-stakes situations because users cannot verify or control what gets sent.

- Fear of incorrect transcription
- No way to review or edit before submission
- One mistake leads to wasted time or wrong outcomes

> Core issue = Lack of trust due to missing verification & control

Who Are the Customers Facing the Problem?

High-stakes Indian college students (**18–24**) using ChatGPT on mobile during:

- Semester exams & entrance tests (CAT, GATE, CLAT)
- Campus placements & job interviews
- Competitive prep (DSA, aptitude, internships)

Shared traits:

- Time-pressured
- Consequence-aware
- Precision > convenience

How Do We Know This Is a Real Problem?

Evidence-based signals:

- **48%** tried voice and stopped using it
- **74%** of objections tied to: Can't see/edit before sending (**48%**) + Accuracy concerns (**26%**)
- One bad experience leads to abandonment
- Users explicitly say they'd return with verification

> This is observed behavior, not hypothetical feedback

Value Generated — For Users

- Confidence in high-stakes moments
- Ability to catch and fix errors before sending
- Faster workflows without sacrificing precision
- Reduced anxiety during exams & interviews

Outcome: "Voice becomes usable when it matters most"

Value Generated — For the Business

- Voice adoption increases **28%** → **80%+**
- **52%** adoption uplift from one feature
- Stronger mobile engagement & habit formation
- Higher long-term retention and monetization

> High ROI from a focused, low-scope fix

Why Solve This Now?

- Large, validated student user base already exists
- Voice tech accuracy has matured — UX is the bottleneck
- **48%** "almost adopted" users are easy to convert
- Early habit formation drives long-term value

Insight: "This is a timing + UX opportunity, not a tech gamble"

This isn't a voice problem. It's a trust and control problem — and it's solvable.
